

The Pros of Hiring a Freelance App Developer

Is your business focused on anything but IT? Do you need a programmer to complete only a short-term project and then they will be no longer needed? Or do you have a short deadline and have to find a developer in just a week? Then, you should consider hiring a freelance app developer.

This form of cooperation is still quite new, but can lead to considerable savings for your project. Here are few reasons why you may want to decide on a freelancer over a development company.

Reliable and Proven Candidates

With a freelance app developer for hire through a software house, there is one huge advantage—it's the software house that takes the responsibility to pick only the best candidates. As their employees work both for them and are sometimes hired by companies like yours, they have to be convinced of their IT specialists' expertise and team-working skills. Otherwise, they'll put their own reputation at risk.

Best Specialists on the Market

When you hire a freelance developer through a software house, the work experience is typically much larger than that of a company team. They've had the opportunity to be a member of many projects and teams, so they have the wider spectrum of knowledge about a large number of technologies and cases.

Software house employees also have access to the best technologies, programs, and tools. They can learn from more experienced colleagues and make use of the press, books and courses provided by their employer.

Economies of Scale

Do you need a really good app developer? But do you need him only for a couple of months or only for a small part of the larger job? Most of the best IT pros don't like to be treated this way.

They are looking for stability and new challenges at work. And since the best programmers can easily choose any job they want, they will only work in the environment which allows them to develop their careers, with the best software and hardware included. A part-time job with no specialistic tools provided can be not so tempting for them. So you'll have to invest significantly to tempt a really good programmer.

It is easier to turn to a software house which employs the pros and already provides their employees with any software, hardware and tools they may need, for as long as you need.
