

## General steps in order to use the prompts effectively

Many of the prompts you will see are initial general ideas or concepts. In order for any type of AI to give you good results you have to expand on these ideas and concepts and get as specific as possible in your requirements. That is how you get as close as possible to a finished product or actionable plan.

### Steps to take:

1. First of all try to choose to expand on ideas and concepts on which you have some sort of basic knowledge on the topic. It will be easier for you to understand how you can move forward after ChatGPT's initial response and you will also be able to spot errors if there are any. This doesn't mean you can not approach a topic where you have almost no knowledge but it will be much easier if you do have some.
2. Most prompts are based on a concept and idea and the secret to obtain a better or refined response is to make a prompt very specific.

Such an example is the idea of creating an AR language translation app. This is an idea and ChatGPT will layout a general plan on how to do it but it is far from getting the final source code of the app. So a more specific prompt will help you to actually get started with building the code and the actual app.

A more specific prompt (this is based on your preferences) would be "Create an AR mobile for iOS that automatically detects text written on paper and translates it into Spanish"

You can follow such an example here: <https://chat.openai.com/share/c8450e1c-5d2a-4119-940c-70b0e022af72>

3. Expand on the initial step-by-step plan that ChatGPT provides to you by asking it to expand and give details for each specific steps.
4. After that put together the answers if needed and refine till it gets the final product or as far as it can.

**Conclusion:** If your initial prompt is a general idea or concept try to be creative and specific on it so you can get the best result possible. After that expand on that initial result based on the step-by-step or explanation given.
